# AT&T Reaches Out to Public and Apologizes for Breakdown

**: Telecommunications:** The firm suspects that a 'bug' in computer software caused its system's collapse. It may offer restitution to some and a day of discounted rates to all.

**January 17, 1990** | KAREN TUMULTY | TIMES STAFF WRITER

NEW YORK — American Telephone & Telegraph, embarrassed and apologetic after its biggest long-distance breakdown ever, suggested Tuesday that it might make restitution to some victims and may offer all customers one day of discounted rates.

Company Chairman Robert E. Allen further admitted that AT&T operators compounded the problem during the early hours of the system collapse Monday by refusing to give customers the phone numbers they needed to gain access to competitors' long-distance systems.

Ultimately, he said, operators were instructed to "offer those numbers to our customers in the event they asked for them."

The problem is particularly embarrassing to the company because it has made reliability the cornerstone of its effort to win back market share from its smaller competitors. Although it is not yet clear how much,

# Null Island

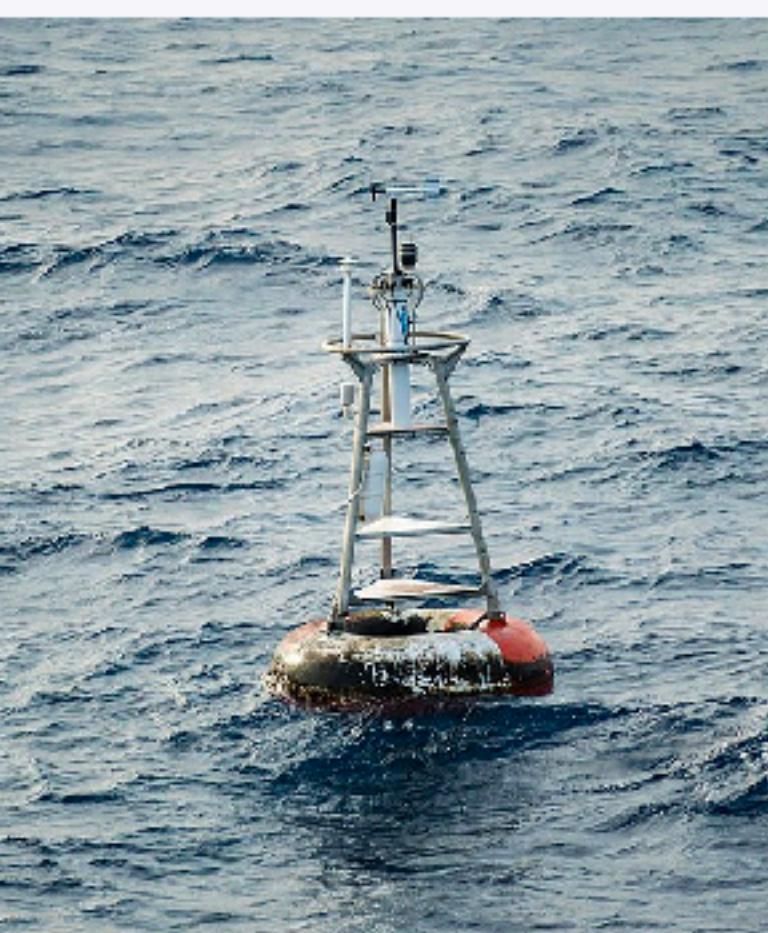

From Wikipedia, the free encyclopedia

Coordinates: 0°N 0°E

**Null Island** is a fictional island in the Gulf of Guinea added to the Natural Earth public domain map dataset,<sup>[1]</sup> located where the equator crosses the prime meridian, at coordinates 0°N 0°E.<sup>[2][3][4]</sup> Natural Earth describes the entity as a "1 meter square island" with "scale rank 100, indicating it should never be shown in mapping."<sup>[1]</sup> Although intended humorously, the fiction has a serious purpose and is used by mapping systems to trap errors.<sup>[3]</sup> Such errors arise, for example, where an image artifact is erroneously associated to the location by software which cannot attribute a geo-position, and instead associates a latitude and longitude of "Null, Null" or "0,0".<sup>[5]</sup> Null Island was developed as an idea in 2011 or slightly earlier. Since then, numerous web pages have documented this fictional landmass's flag, geography, and history.<sup>[6]</sup>

In reality, a weather observation buoy, part of the PIRATA system, is moored at the supposed location of the island.<sup>[7]</sup> The depth at this place is around 4,940 metres (16,210 ft).<sup>[8]</sup>

COURTNEYK

A hacker stole almost £100,000 by exploiting a loophole in Clydesdale Bank's online banking system

A UK hacker has been jailed for stealing almost £100,000 from a bank by exploiting a bug in the bank's online banking system.

James Ejankowski, who's 24, defrauded Clydesdale and Yorkshire Banking Group of more than £99,000 in December 2016.

He spent the money on a BMW, a Range Rover and tattoos for his face.

# Introducing Rocket.

Rocket is a web framework for Rust that makes it simple to write *fast* web applications without sacrificing flexibility or type safety. All with minimal code.

[Get Started](#)[Learn More](#)

---

Latest Release: 0.3.3 (Sep 25, 2017)

---

## Type Safe

From request to response Rocket ensures that your types mean something.

[Learn More](#)

## Boilerplate Free

Spend your time writing code that really matters, and let Rocket generate the rest.

[See Examples](#)

## Easy To Use

Rocket makes extensive use of Rust's code generation tools to provide a clean API.

[Get Started](#)

## Extensible

Easily create your own primitives that any Rocket application can use.

[See How](#)

```
1 #[feature(plugin)]
2 #[plugin(rocket_codegen)]
```

## Hello, Rocket!

```
1 #[get("/user/<id>")]
2 fn user(id: usize) → T { ... }
3
4 #[get("/user/<id>", rank = 2)]
5 fn user_int(id: isize) → T { ... }
6
7 #[get("/user/<id>", rank = 3)]
8 fn user_str(id: &RawStr) → T { ... }
9
```

```
1 #[get("/admin")]
2 fn admin_panel(admin: AdminUser) → &'static str {
3     "Hello, administrator. This is the admin panel!"
4 }
5
6 #[get("/admin", rank = 2)]
7 fn admin_panel_user(user: User) → &'static str {
8     "Sorry, you must be an administrator to access this page."
9 }
10
11 #[get("/admin", rank = 3)]
12 fn admin_panel_redirect() → Redirect {
13     Redirect::to("/login")
14 }
```

```
1 #[get("/")]
2 fn index(cookies: Cookies) → Option<String> {
3     cookies.get("message")
4         .map(|value| format!("Message: {}", value))
5 }
6
7 #[derive(FromForm)]
8 struct Task {
9     complete: bool,
10    description: String,
11 }
12
13 #[post("/todo", data = "<task>")]
14 fn new(task: Form<Task>) → String { ... }
15
16 #[derive(Deserialize)]
17 struct Task {
18     description: String,
19     complete: bool
20 }
21

# Diesel is a Safe, Extensible ORM and Query Builder for Rust

Diesel is the most productive way to interact with databases in Rust because of its safe and composable abstractions over queries.

[Get Started](#)[View on Github](#)

## Why did we make Diesel?

### Preventing Runtime Errors

We don't want to waste time tracking down runtime errors. We achieve this by having Diesel eliminate the possibility of incorrect database interactions at compile time.

### Built for Performance

Diesel offers a high level query builder and lets you think about your problems in Rust, not SQL. Our focus on zero-cost abstractions allows Diesel to run your query and load your data even faster than C.

### Productive and Extensible

Unlike Active Record and other ORMs, Diesel is designed to be abstracted over. Diesel enables you to write reusable code and think in terms of your problem domain and not SQL.

```
1 fn main() {
2     use diesel_demo::schema::posts::dsl::*;
3
4     let connection = establish_connection();
5     let result = posts.filter(published.eq(true))
6         .limit(5)
7         .load::<Post>(&connection);
8     let posts = match result {
9         Ok(posts) => posts,
10        Err(message) => {
11            println!("ERROR: {}", message);
12            return;
13        }
14    };
15
16    println!("Displaying {} posts", posts.len());
17 }
```

```
1 infer_schema!("dotenv:DATABASE_URL");
2
3 #[derive(Queryable)]
4 pub struct Post {
5     pub id: i32,
6     pub title: String,
7     pub body: String,
8     pub published: bool,
9 }
```

```
1 infer_schema!("dotenv:DATABASE_URL");
2
3 #[derive(Queryable)]
4 pub struct Post {
5     pub id: i32,
6     pub title: String,
7     pub body: String,
8     pub published: bool,
9 }
```

```
